Outline

- NV Centres – defect centres in diamond which, along with surrounding ^{13}C, constitute promising platforms for effective qubits

- Model and simulation – implemented an error model to simulate decoherence

- Dynamical decoupling – with perfect and imperfect π-rotations to extend decoherence time for spin qubits

Nitrogen-Vacancy Centres

- NV centres are spin-1 defects in the crystal structure of diamond, effective 2-level system

- ^{12}C bath protects spin of NV

- Surrounding ^{13}C atoms (spin-1/2) can be used as storage qubits

- Main Challenge – mitigating decoherence through dephasing noise due to magnetic fluctuations from surrounding ^{13}C spin bath[1]

System Simulation

Evolution of state:

$$\frac{d\rho}{dt} = -\frac{i}{\hbar}[H, \rho]$$
ρ Density matrix.

H Hamiltonian.

Numerical simulations performed with *Runge-Kutta 4*.
Error model:[‡]

$$H(t) = \delta\omega(t)\sigma_Z$$

Auto-correlated normal noise (average final values 960 times),

$$\langle \delta\omega(t)\delta\omega(0)\rangle = b^2 e^{-|t|/\tau_c}$$

Correlated noise employed in the simulations.

$\tau_c = 10^5$

$b = 0.05$

‡ Wang, Zhi-Hui et al. "Comparison of Dynamical Decoupling Protocols for a Nitrogen-Vacancy Center in Diamond." Physical Review B 85.15 (2012): https://doi.org/10.1103/PhysRevB.85.155204

Spin echo

Simulation parameters:

$$\langle \delta\omega(t)\delta\omega(0)\rangle = b^2 e^{-|t|/\tau_c}$$

$$\tau_c = 10^5 \qquad b = 0.05$$

Fit function:

$$P_x = \frac{1 + e^{-(t/T_2)^n}}{2}$$
Theory:
$$\begin{cases} T_2 = 782 \\ n = 3.0 \end{cases}$$

Simulation:
$$\begin{cases} T_2 = 310(3) \\ n = 3.0(1) \end{cases}$$

# Dynamical Decoupling

Same simulation parameters

Same fit function: $P_x = \dfrac{1 + e^{-\left(t/T_{\frac{1}{e}}\right)^n}}{2}$

Theory: $n = 3.0$

Worst simulation: $n = 2.90(7)$

Dynamical Decoupling

Dynamical Decoupling on NV-centre
Scaling of $T_{1/e}$ with Dynamical Decoupling

$$T_{\frac{1}{e}} = T_2 \left(\frac{N}{2}\right)^p$$
$p_{\text{theory}} = 2/3$

$p_{\text{simulation}} = 0.663(1)$

Dyn Decoupling

Dynamical Decoupling on NV-centre

- Same qualitative features between simulation and experiment (envelope)
- Values of n for the fit vary from 1.8 to 2.8

† Abobeih, M.H., Cramer, J., Bakker, M.A. et al. One-second coherence for a single electron spin coupled to a multi-qubit nuclear-spin environment. Nat Commun 9, 2552 (2018). https://doi.org/10.1038/s41467-018-04916-z

NV-Carbon Interaction

- Hamiltonian of the ^{13}C atoms is dependent on the NV centre spin state

$$H_0 = \omega_L \hat{S}_z$$

$$H_1 = \left(\omega_L + w_h cos\theta\right)\hat{S}_z + w_h sin\theta\,\hat{S}_x$$

- Raises possibility of individual control because each ^{13}C has its own resonance with the NV centre
Dynamical Decoupling and Entanglement Generation

- Initialize NV in $|+\rangle$ and the ^{13}C in the mixed state ρ_m

- Due to conditional interaction between NV and Carbon only at special resonant frequencies, entanglement appears as small peaks

- Simulation coincides perfectly with the theoretical prediction[*]

Dynamical Decoupling on Carbon Atoms
[*] Taminiau, T. H. et al. "Detection and Control of Individual Nuclear Spins Using a Weakly Coupled Electron Spin." Physical Review Letters 109.13 (2012) https://doi.org/10.1103/PhysRevLett.109.137602
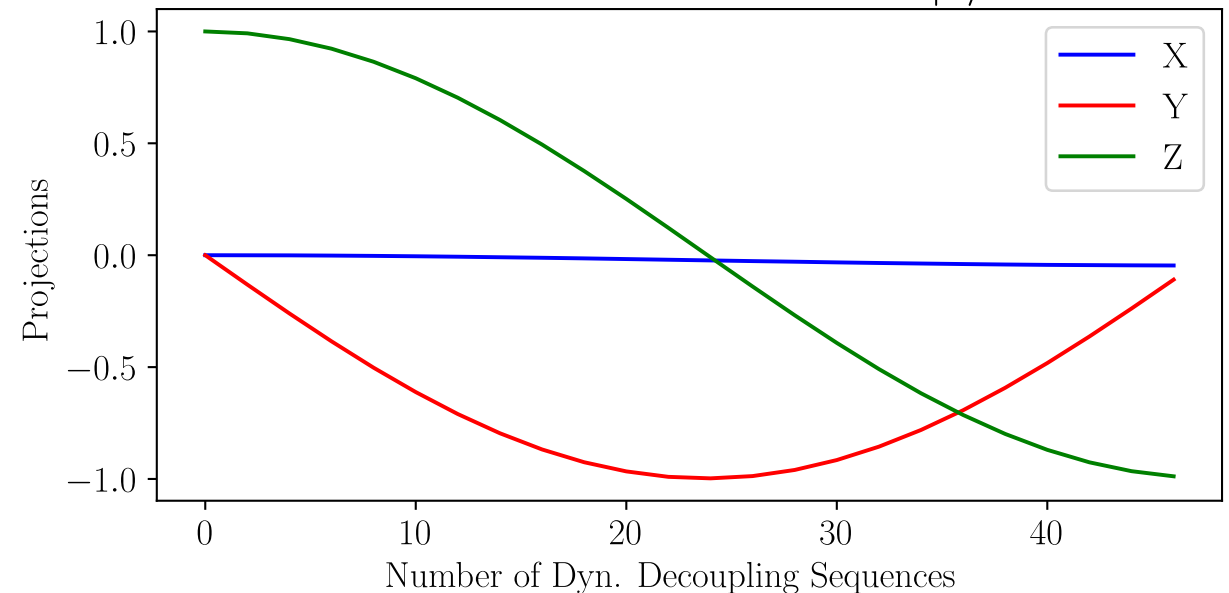

Controlled Rotation of Carbons

- By flipping the spin state of the NV centre at the resonant precession frequency for a ^{13}C, we can implement coherent rotations
- Direction of rotation is conditional on initial spin of the NV
- Even with just ~40 sequences, capable of performing π-rotation with over 99% fidelity
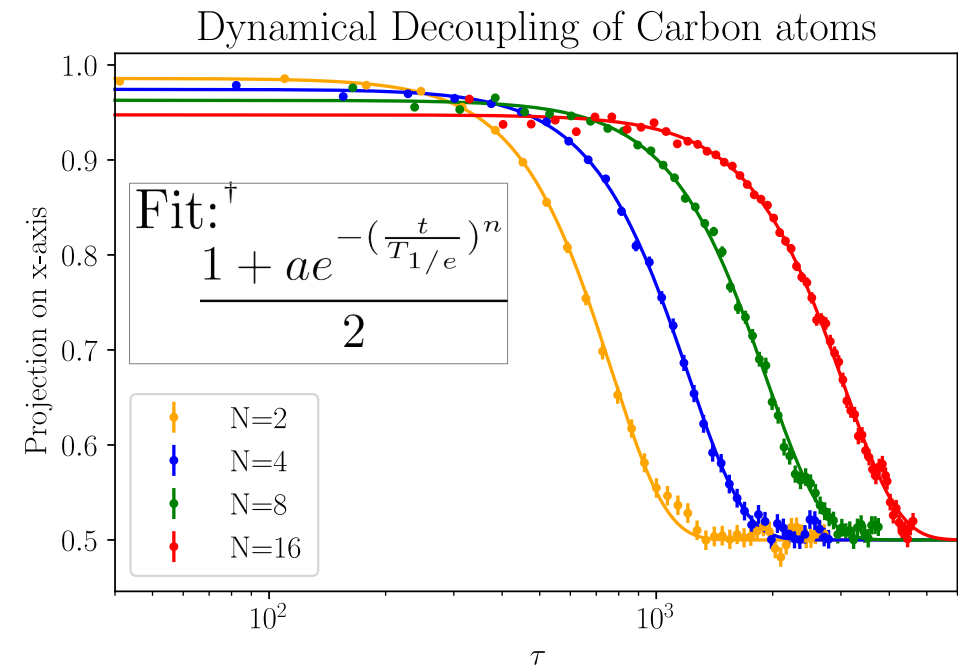

Dynamical Decoupling on Carbon

- To protect the ^{13}C from dephasing noise, we can implement the spin-echo protocol similar to that on the NV

- Main Difference - cannot implement π-rotations directly, must be mediated by NV centre, and thus they take much longer
- More rotations lead to better protection (higher fidelity for longer time)

Dynamical Decoupling of Carbon atoms

Fit:[†]
$$\frac{1 + ae^{-(\frac{t}{T_{1/e}})^n}}{2}$$

- N=2
- N=4
- N=8
- N=16

Improved Protection through Decoupling

Fit:
$$T_{\frac{1}{e}} = T_2 \left(\frac{N}{2}\right)^p$$

$p = 0.663(1)$

$p_{theory} = 2/3$

Conclusion

- Decoherence can be mitigated by to some extent using dynamical decoupling sequences, addressing a key challenge in the use of NV centres as nodes for quantum computing

- Our model qualitatively describes the system's evolution under decoupling sequences, obtaining the values for several parameters correctly

- Due to the way the simulation scales with time, simulating for high N values was not feasible. Performance could be improved by implementing the unitary for time evolution directly rather than solving the differential equation shown above

- Future Outlook – probing the effect of different types of decoupling sequences on the spin qubits, as done in recent papers[†]
